CUSTOMER STORY

#industrialsupplies

#software

Bergerat Monnoyeur delivers an average of 100.000 references delivered per year, including 80.000 managed in stock on their 18.000 m2 platform. Eager to better manage carrier assignments and strengthen its shipping processes, the exclusive Caterpillar dealer selected SAVOYE for the TMS features of the ODATiO software solution, which complements the existing SAVOYE WMS solution.

TARGETS

- 01 To increase the robustness of its transport organization
- 02 To offer its customers the most accurate parcel tracking
- 03 To meet major challenges in terms of costs and compliance with deadlines

WHY SAVOYE?

- The clarity and quality of the proposed offer
- The ability of ODATiO and the project team to address our four main needs through a structured approach

Supply Chain Director

“ODATiO will allow us to choose from our ten carriers according to the type of demand, the level of urgency, the locality to be served, the weight of the package, etc. It will therefore be able to assign the best transport scheme while meeting major challenges in terms of costs and compliance with deadlines.”

Present across various sectors such as public works, landscaping, mining, road construction, and industry, Bergerat Monnoyeur, exclusive dealer of Caterpillar and Sandvik in France, handles equipment sales, rental, and after-sales service via 40 workshops throughout the country.

These sites offer repair, maintenance, and rebuild services, supported by a logistics platform in Saint-Denis that ensures spare parts supply with express and standard delivery options.

Covering 18,000 m², the Saint-Denis site manages nearly 100,000 references per year, with 80,000 held in stock. Until now, transport flows were managed using the company's ERP and SAVOYE's WMS, as no dedicated TMS was in place. To improve shipment processes and better allocate carriers, Bergerat Monnoyeur selected SAVOYE's ODATiO, a cloud-hosted, web-responsive transport management solution.

In addition to improved shipment visibility, ODATiO allows better control over transport costs, invoice validation, and pre-invoicing. The tool's intuitive interface, accessible from any device, ensures quick user adoption and operational flexibility.

The TMS deployment is organized into three phases: initial configuration of transport cost rules by shipment type, integration and validation of carrier invoices, and performance tracking with reporting tools to monitor logistics efficiency.
